

FinFlow

UiPath AgentHack 2026 | Track 1: Maestro Case

- AI-powered loan case intelligence
- Human-in-the-loop decisions
- Synthetic demo data only

Problem

Loan operations are fragmented.

- Documents, credit, compliance, and approvals live in separate tools.
- Officers need traceability and exception control.
- Black-box automation is not enough for regulated lending.

Solution

A case workflow for loan decisions.

- Case pipeline from intake to final approval
- Document review and exception handling
- Deterministic recommendations with audit trail

UiPath Role

UiPath-ready orchestration boundary.

- Maestro Case stages and transitions specified under /uipath
- Action Center forms for document review and final decision
- Agent Builder prompts for DocuMind, CreditSage, ComplianceGuard

Architecture

React + FastAPI + SQLite + UiPath adapter.

- Frontend shows live case, event, exception, and analytics state.
- Backend exposes workflow APIs and webhook callbacks.
- Simulated UiPath client is swap-ready for Automation Cloud credentials.

Demo Flow

One reproducible workflow.

- Run strong or weak demo case
- Review documents and exceptions
- Approve, reject, or refer with visible audit trail

Evidence

Truthful current status.

- Public GitHub repo with MIT license and README
- Local tests/build/lint verified
- UiPath Labs proof pending access; mock providers clearly labeled

Next

Automation Cloud import and final video proof.

- Import prepared UiPath specs into Labs tenant
- Record platform run when access is available
- Submit final Devpost once video/proof links are accepted
